                                                                                                                                                                                                                                                                                                                  During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:; EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_legans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6
RP1-83M4 is from the library RPCI-1 constructed by the group of Pieter de Jong. For further details see
                                                                                                                   once, except for a 100 base overlap.

The true left end of clone RP1-83M4 is at 1 in this sequence. The true left end of clone RP1-91J24 is at 104129 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTE: Estimated insert size may differ from sequence length

  CC polynicipotides encoding the proteins. The polypeptides are useful for cc modulating the expression of human RNA binding proteins (RNABP) which CC play a role in cancer, immune disorders and developmental disorders. CC Disorders associated with a decrease of RNABP include: cancers such as CC adenocarcinoma, leukemia, lymphoma, melanoma, myeloma, sarcoma, CC teratocarcinoma, and, in particular, cancers of the adrenal gland, CC bladder, bone, bone marrow, brain, breast, cervix, gall bladder, ovary, CC gastrointestinal tract, heart, kidney, liver, lung, muscle, ovary, CC pancress, parathyroid, penis, prostate, salivary glands, skin, spleen, CC testis, thymus, thyroid, and uterus, immune disorders such as acquired contents, thymus, thyroid, and uterus, immune disorders such as acquired contents, syndrome (AIDS), Addison's disease, adult respiratory (CC distress syndrome, allergies, ankylosing spondylitis, amyloidosis, CC disease, atopic dermatitis, cholecystitis, contact dermatitis, autoimmune thyroiditis, expired and the respiratory of disease, atopic dermatitis, dermatemyositis, diabetes mellitus, CC disease, atopic dermatitis, dermatomyositis, glomerulonephritis, CC disease, atopic dermatitis, dermatorome, multiple sclerosis, CC disease, disease, myocardial or pericardial inflammation, contents of thyroiditis, contents of thyroiditis, cylonery myositis, psoriasis, CC contents of the proteonic anabhylavis exertemic lunna corretamation; corretamic curretamic curretami
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated and purified polynucleotide for modulating the expression human RNA binding proteins which play a role in cancer, immune disorders and developmental disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disorders and developmental disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides human RNA binding proteins (RNABP) and

The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic mouse for the study of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and achondroplasia. This sequence encodes a human LOBO protein described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel nucleic acids (I; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity.
                                                                                                                                                                                                                                                                                                                                                                                                   Bordetella pertussis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Filamentous haemagglutinin fragment 7 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Filamentous haemagglutinin; FHA; endothelial cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1925 ACCTGCATCTTGCCCGCGTTGCGCGCGCGCGCCCGGAAGTCGTCAGCGTGGC 1876
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This DNA sequence codes for 'fragment 7' (see AAW69594) of Bordetella pertussis filamentous haemagglutinin (FHA). Fragment 7 includes the RGD tripeptide that corresponds to amino acid residues 1097-1099 of FHA, and a carbohydrate recognition site corresponding to amino acid residues 1141-1279 of FHA. Truncated FHAs (see AAW69595) which delete the RGD region can be produced genetically and are useful as vaccines against whosping cough. The invention also provides peptides and antibodies which inhibit the reaction between the RGD tripeptide of FHA and the integrin receptors of endothelial cells and their utility as therapeutic agents, as well as a method of increasing the permeability of the blood-brain barrier using an antibody to the FHA RGD region.
                                                                                                                                                                                   Filamentous hemagglutinin; FHA; Factor X; leukocyte; blood vessel endothelial cell; migration; inflamed tissue; non-fimbrial surface associated protein; Bordetella pertussis; C3bi; RGD tripeptide; integrin receptor; inflammation; antibiotic therapy;
                                                                                                                 Bordetella pertussis.
                                                                                                                                                                                                                                                                      Nucleic acid encoding fragment 7 of filamentous hemagglutinin.

FHA is a non-fimbrial surface associated protein.

As there are four regions in FHA with sequence similarity to three regions in Factor X, some antibodies to these four regions cross-react with Factor X, and vice versa. The specification describes FHA peptides which interact with leukocytes or with blood vessel endothelial cells, thereby inhibiting the migration of leukocytes from the blood steam into inflamed tissue. FHA peptides competitively inhibit binding of Factor X and C3bi to leukocytes. Specifically, the peptides inhibit the reaction between the RGD tripeptide of FHA and the integrin receptors of endothelial cells. The FHA peptides (and antibodies to them) dampen inflammation during the course of therapy with antibiotics and are therefore useful in the treatment of infections e.g. meningitis, septic arthritis, and endophathalmitis, and inflammation arising from autoimmune

The peptides and methods are useful for reducing inflammation during the course of antibiotic therapy of infectious diseases such as meningitis, septic arthritis, and endophathalmitis. The present sequence encodes fragment 7 of the FHA protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes peptides which inhibit adhesion between leukcytes and endothelial cells, and peptides which inhibit adhesion between bacteria (Bordetella pertussis) and cilliated respiratory epithelial cells. The specification also describes an immunogenic

The compositions are used to improve delivery of (1) to the brain, e.g. where (1) is used to treat brain cancer, acquired immune deficiency syndrome, epilepsy, Parkinson's or Alzheimer's diseases or other neurological diseases. Other antibodies directed against particular regions of FHA are used to treat inflammation (caused by microbial infection or auto-immune disease), also to prevent adhesion of Bordetella pertussis to respiratory endothelial cells. The present sequence represents a FHA fragment 7 encoding gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a novel pharmaceutical composition for increasing the permeability of the blood-brain barrier to a molecule (I). The composition comprises (I) and an antibody to FHA (filamentous hemagglutinin) which binds to endothelial cells in brain blood vessels, increasing permeability. FHA contains polypeptide regions with binding properties similar to those of complement C3bi, factor x and integrin receptor CR3, and some anti-FHA antibodies are competitive inhibitors of these materials, i.e. they reduce leukocyte migration or bacterial adheren
                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3744 BP;

This sequence represents the filamentous haemagglutinin gene, fhab, from CC Bordetella pertussis. Bordetella pertussis is a small Gram negative controllus found only in humans and which causes whooping cough (pertussis) in children. Filamentous haemagglutinin (FHA) is a 368 kD surface-cc associated protein which is thought to be one of the most important cf factors in mediating the adhesion of the bacterium to a eukaryotic (human) cell. FHA also stimulates an immune response in humans following cc disease, and has been shown to act as an immune products, are used for cr animal model. The FHA gene, or its expression products, are used for prevention or treatment of pertussis, particularly in vaccines. It may calso be used to increase the amount of FHA in live or dead Bordetella pertussis or other organisms. Fragments of the gene may be used as clinicativity of Bordetella pertussis. FHA, or fragments thereof, may be used in immunoassays to detect anti-FHA antibodies, and to raise cc antibodies for the diagnosis, prevention of treatment of whooping cough.

This sequence encodes a human protein kinase C inhibitor (designated IPKC-1) initially identified among the partial cDNAs (Incyte clones shown in AAT76789-93) from a THP-1 library (THPIPEB01). IPKC may be useful for diminishing multiple drug resistance in cancer chemotherapy, for treating melanomas or other cancers, for treating autoimmune diseas

The relative GC content of the ORF is 67.5%. The DNA and recombinant peptides produced from it are useful diagnostically and therapeutically against pertussis. Dosage is pref. 25-75 microg/kg (single dose)
                                                                                                                      DNA encoding protein kinase C inhibitor polypeptide - useful diminishing multiple drug resistance in cancer chemotherapy

The nucleic acid sequence, oligonucleotides and antiseas equences derived from the IPKC-1 coding sequence or the Incyte clones can also be used in diagnostic assays of body fluids or biopsied tissues to detect the expression level of IPKC-1, or to monitor modulation of the transcripts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This cDNA encodes a human protein kinase C inhibitor polypeptide homolog (IPKC). IPKC and compositions containing IPKC are useful for treating diseases and conditions associated with protein kinase C, such as multiple drug resistance, cancer, especially lymphoma, intestinal and breast cancer, memory disorders, as observed in sufferers of Alzheimer's disease, and auto-immune disorders such as rheumatoid arthritis, multiple sclerosis and myasthesia gravis. IPKC is more selective in its mode of inhibition, and has less risks associated with toxicity compared with

The IPKC gene can be used in the diagnosis, study, prevention and treatment of disease associated with PKC, e.g. to diminish multidrug resistance while maintaining the sensitivity of tumor cells to chemotherapy, for treating cancers, to induce apoptosis, e.g. in autoimmune disorders such as rheumatoid arthritis, multiple sclerosis, and myasthenia gravis, and
                                                                                                                                   CDS

are useful
                                                                                                                                                                                          The invention relates to an isolated transcription factor gene which is expressed in a recombinant maturing dicot seed and which encodes a transcription factor protein which targets a promoter of a gene encoding seed storage proteins, lectins or oil-body proteins. The transcription factors isolated are Pv-Seed factor-1 (ROM1) and Vicilin-box binding protein-1 (ROM2). These factors bind to 7S-globulin (b-phaseolin) or lectin (PHA-L) promoters. The transcription factor gene is useful for enhancing or reducing expression of seed storage protein, lectin or oil-protein genes in dicot seed crops. The present sequence represents the nucleotide sequence of bZIP2 (basic leucine zipper) cDNA.

                                                                                                                                                                                                                                  alignment_scores:
                                                                                                                                                                                                                                                                                                                                             The present invention describes methods of obtaining immunogenic CC proteins from Neisseria genomic sequences. AAA81453 to AAA82414 CC represent specifically claimed Neisseria meningitidis genomic DNA CC represent specifically claimed Neisseria meningitidis genomic DNA CC sequences; AAA81260 to AAA81303 and AAB25620 to AAB2563 represent CC Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81312 represent PCR primers used in the CC canabation of Neisseria meningitidis DNA sequences; and AAA8132 to CC AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF CC capuences, which are all used in the exemplification of the present CC sequences, which are all used in the exemplification of the present CC sequences, which are all used in the manufacture of a composition. The nucleic acid sequences, protein sequences, and antibodies composition can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a composition of the present CC composition can be used as a medicament (or in the manufacture of a composition of the too the components of vaccines against Meningococcus B; against all serotypes; CC and/or against all pathogenic Neissariae. Identification of sequences composition by accines have failed mainly due to antigen to Jerance. CC Meningococcus B vaccines have failed mainly due to antigen to Jerance. CC sequences may provide an opportunity to Jentify secreted or surface.

     Score

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

MCCarthy J.K., Sullivan R.F., Eveleigh D.E.;

"Cloning and characterization of gluco-oligosaccharide catabolic

pathway: beta-glucan glucohydorlase and cellobiose phosphorylase, in
the marine hyperthermophile Thermotoga neapolitana.";

Submitted (MAR-2000) to the EMBL/GenBank/DDBJ databases.
